

Macroeconomics in One Equation

Lecture 2: National Income and Wealth

Biwei Chen

For His Glory and Mission

Business & Economics
Houghton College

Income is a Series of Events

Income is a series of events. ... For each individual only those events which come within the purview of his experience are of direct concern. It is these events—the psychic experiences of the individual mind—which constitute ultimate income for that individual. The outside events have significance for that individual only in so far as they are the means to these inner events of the mind. ...

Enjoyment income is a psychological entity and cannot be measured directly. We can approximate it indirectly, however, by going one step back of it to what is called real income. Real wages, and indeed real income in general, consist of those final physical events in the outer world which give us our inner enjoyments.

This real income includes the shelter of a house, the music of a victrola or radio, the use of clothes, the eating of food, the reading of the newspaper and all those other innumerable events by which we make the world about us contribute to our enjoyments. Metaphorically we sometimes refer to this, our real income, as our "bread and butter."

Irving Fisher (1930) CH1, "The Theory of Interest, as determined by Impatience to Spend Income and Opportunity to Invest it." Liberty Fund Press.

Basic Concepts: GDP and GNP

Gross Domestic Product (GDP)

The market value of final goods and services produced within a country in a given period of time. Or, nominal GDP. Domestic in geography.

Gross National Product (GNP)

The market value of final goods and services produced by a country's citizens in a given period of time. Or, nominal GNP. National in citizenship.

Real Gross Domestic Product (RGDP)

Nominal GDP adjusts for the effect of the price change over time.

GDP growth rate is the percentage change in GDP over time.

GDP per capita is the GDP of a nation over its total population.

Basic Concepts: Income and Wealth

Income is a Flow, Wealth is a Stock.

Income is the alpha and omega of economic life. Wealth is net total income.

National Income (NI)

GDP minus the depreciation of the capital stock used in production processes, plus net incomes received from or paid to the rest of the world.

National Wealth (NW)

The stock of assets owned by nationals of the country (both in that country and abroad), private (owned by individuals) or public (owned by the state).

Net Household Wealth

The sum of financial (e.g. deposits, stocks, bonds, equity) and non-financial (e.g. housing, business) assets, net of debts, possessed by individuals.

Basic Concepts: Personal Income

Personal Income

The income received by, or on behalf of, all persons from all sources: from laborers in production, from owning a home or business, from the ownership of financial assets, and from government and business in the form of transfers. It includes income from domestic sources and the rest of world. It does not include realized or unrealized capital gains or losses.

Disposable Personal Income

Personal income less personal current taxes. It is the income available to persons for spending or saving.

Personal Outlays

The sum of personal consumption expenditures, personal interest payments, and personal current transfer payments.

Personal Saving

Personal income less personal outlays and personal current taxes. Personal saving rate is personal saving as a percentage of disposable income.

Basic Concepts: Income Inequality

Gini Coefficient

A measure of income inequality based on the comparison of cumulative proportions of the population against cumulative proportions of income they receive. It ranges between 0 (perfect equality) and 1 (perfect inequality).

Palma Ratio

The share of all income received by the 10% people with highest disposable income divided by the share of all income received by the 40% people with the lowest disposable income.

Theil Index

The importance of between-country inequality in overall global inequality (between-country and within-country together).

Purchasing Power Parity (PPP)

Adjustment for the cost-of-living differences across countries in comparison.

Introduction

Gross domestic product measures the economy and helps size up its progress: Is it booming, slumping or something in between? GDP also helps Americans see historical trends, make projections about the economic future, and compare their economy to other nations (US Bureau of Economic Analysis).

- Fundamentals of the GDP statistics and its measurement techniques (nominal vs real GDPs)
- Three approaches to national income measurement: the product (value-added), the expenditures (demand), and the income
- A breakdown of the four components in GDP from the aggregate demand (expenditures) of the economy
- Applications of national income statistics in economic growth, international comparison, income and wealth inequality studies
- Classical and Keynesian theories and models behind national income determination and distribution

GDP Measures the Size of U.S. Economy

Gross Domestic Product

Total market value

Within the United States

Goods and services

GDP = the **total market value** of the **goods and services** produced **within the United States** in a year.

A **good** is a video game, a car, an apple, a gold ring. Goods are things that people make, grow or extract from the land.

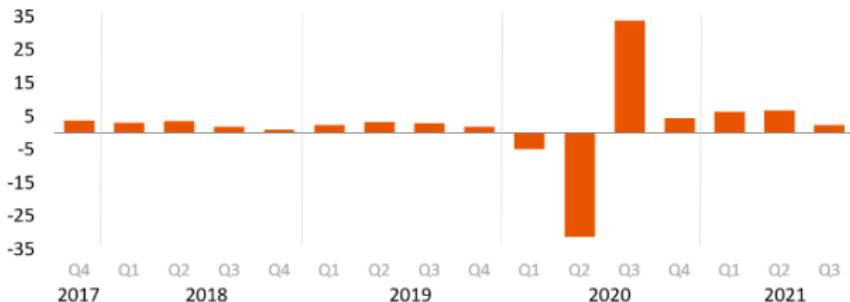

A **service** is a haircut, a bus ride, computer repair, a doctor's care. Services are actions that people do for someone else.

Market value is how much something costs in the marketplace. It's what you pay for that video game or haircut.

Why is GDP Important to the U.S. Economy?

- In the U.S., Economists at the U.S. Bureau of Economic Analysis estimate GDP using thousands of data points gathered by other federal agencies and some private data collectors.
- The pace of economic growth or decline affects jobs, businesses and investments. Understanding the economy helps the public and policymakers make informed decisions. GDP also helps compare the U.S. economy with economies around the world.
- Congress, the White House, the Federal Reserve, state and local governments, business leaders, analysts and researchers, and the American public rely on GDP and related statistics from the Bureau of Economic Analysis.
- These statistics inform decisions about taxes and spending, hiring and investing, interest rates and trade policy, and more.

The map reveals how the country's economic output is concentrated in a select number of metro areas. New York stands head and shoulders above the rest, generating \$1.77T in GDP each year, far ahead of second place Los Angeles at \$1.05T. The greater New York area has a larger economy than all of Russia. The top 10 metros alone account for over 37% of the entire economic output for all American metros, or about \$6.15T.

Measuring the National Income: NIPAs

- How fast is the economy growing? Is it speeding up or slowing down? How does the trade deficit affect economic growth? What's happening to the pattern of spending on goods and services in the economy?
- To answer these types of questions about the economy, economists and policymakers turn to the national income and product accounts (NIPAs) produced by the Bureau of Economic Analysis (BEA).
- The NIPAs are a set of economic accounts that provide information on the value and composition of output produced in the U.S. during a given period and on the types and uses of the income generated by that production. Featured in the NIPAs is GDP.
- To fully understand an economy's performance, one must ask not only "What is GDP?" but other questions such as: "Who is producing the output of the economy?" "What output are they producing?" "What income is generated as a result?" and "How is that income used?"

Measuring the National Income: The Economists

Simon Kuznets

The Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel 1971

Born: 30 April 1901, Pinsk, Russian Empire (now Belarus)

Died: 8 July 1985, Cambridge, MA, USA

Affiliation at the time of the award: Harvard University, Cambridge, MA, USA

Prize motivation: "for his empirically founded interpretation of economic growth which has led to new and deepened insight into the economic and social structure and process of development."

Contribution: Extensive research on the economic growth of nations, developed methods for calculating the size of, and changes in, national income.

Prize share: 1/1

Richard Stone

The Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel 1984

Born: 30 August 1913, London, United Kingdom

Died: 6 December 1991, Cambridge, United Kingdom

Affiliation at the time of the award: University of Cambridge, Cambridge, United Kingdom

Prize motivation: "for having made fundamental contributions to the development of systems of national accounts and hence greatly improved the basis for empirical economic analysis."

Contribution: Pioneering research around national accounting systems.

Prize share: 1/1

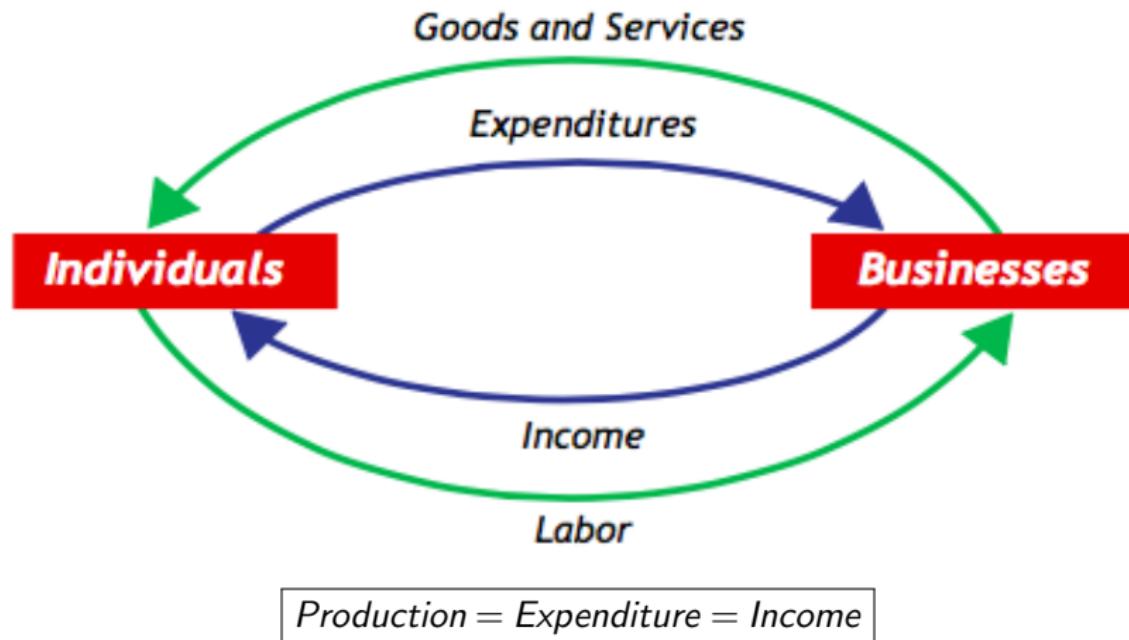

An indication of National Income Accounts' impacts on Economics is that the 3d and 15th Nobel Prizes in economic science were awarded largely for contributions to the development of national income statistics—to Simon Kuznets in 1969 and to Richard Stone in 1984.

NIPAs Summary Accounts

From the NIPAs, three major types of producers (or sectors) are recognized:

- ① Businesses and corporations
- ② Households and (nonprofit) institutions
- ③ General governments.

In the NIPAs, the flows of production-related activities and income between sectors of the economy are summarized in the seven T-accounts:

- ① Domestic Income and Product Account
- ② The Private Enterprise Income Account
- ③ The Personal Income and Outlay Account
- ④ The Government Receipts and Expenditures Account
- ⑤ Foreign Transactions Current Account
- ⑥ Domestic Capital Account
- ⑦ Foreign Transactions Capital Account

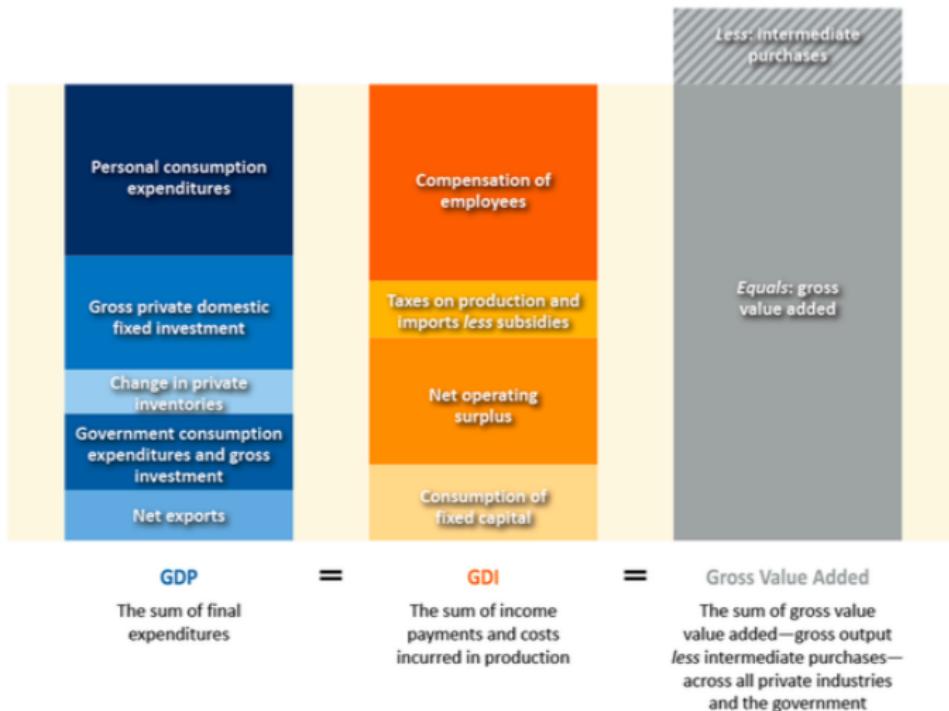

NIPAs Summary Accounts

Transactions	Domestic accounts			Rest of the world
	Business economic sector	Government economic sector	Personal economic sector	
Production	Domestic income and product account (Account 1)			Foreign transactions current account (Account 5)
Income and outlay	Private enterprise income (Account 2)	Government current receipts and expenditures (Account 4)	Personal income and outlay (Account 3)	
Saving and investment	Domestic capital account (Account 6)			Foreign transactions capital account (Account 7)

The Output/Product Approach

The following are several points worth noting when considering the output of the economy.

- ① GDP includes market production and some nonmarket production.
- ② GDP is a measure of current production, not exchange (sales).
- ③ GDP is equal to the value of goods and services for "final" users.
- ④ Whenever possible, GDP is valued at market prices.
- ⑤ GDP can be measured in three different ways.
- ⑥ GDP captures output produced in the U.S.
- ⑦ GDP is a "gross" measure (depreciation).

Source: BEA (2015) *Measuring the Economy: A Primer on the National Income and Product Accounts*

https://www.bea.gov/sites/default/files/methodologies/nipa_primer.pdf

The Income Approach

- This approach measures output as the sum of the incomes accruing to the owners of the factors of production (capital and labor) and to governments. In other words, as the circular flow diagram suggests, income is equal to product.
- In addition to GDP, which is measured using the final expenditures approach, the NIPAs also present gross domestic income (GDI), which is GDP measured using the income approach (GDI is equal to GDP conceptually).
- The NIPAs also include other measures of income: GNI and PI.
 - Gross national income (GNI), the most comprehensive measure of a nation's income, is calculated as GDI plus income receipts from the rest of the world less income payments to the rest of the world. As such, it is a measure of income from production that accrues to U.S. residents, regardless of where that productive activity is located.
 - Personal income is the income received by persons from participation in production (including compensation, proprietors' income, and interest and dividend income) and from transfers from government and businesses. Personal income is closely monitored both as an indicator of economic activity and as a predictor of future spending.

Source: BEA (2015) Measuring the Economy: A Primer on the National Income and Product Accounts

The Expenditure Approach

- ① Consumption (C). In NIPA, personal consumption expenditures consist of purchases of goods and services by households and by nonprofit institutions serving households (NPISHs).
- ② Investment (I). Gross private domestic investment consists of purchases of fixed assets (structures, equipment, and intellectual property products) by private businesses that contribute to production and have a useful life of more than one year, of purchases of homes by households, and of private business investment in inventories.
- ③ Government expenditure (G), Government consumption and investment measures final expenditures by Federal, state, and local governments.
- ④ Exports (EX), which consists of goods and services that are sold, given away, or otherwise transferred by U.S. residents to the rest of the world.
- ⑤ Imports (IM), which is deducted in the calculation of GDP, consists of goods and services that are sold, given away, or otherwise transferred by the rest of the world to U.S. residents.

T-account: Income and Outlay for an Individual

Uses of income		Sources of income	
Consumption	50	Compensation	70
Tax payments	20	Interest received	20
Saving	30	Dividends received	10
Total Expenditures and Saving	100	Total Income	100

A T-account offers another way to illustrate the flows of the economy. More detailed than the circular flow diagram, it is a two-sided table that matches "sources" of funds on the right, or credit side, with "uses" on the left, or debit side. The entries on each side sum to a total shown at the bottom; the totals on each side are equal. As with the circular flow diagram, the T-account shows that income equals expenditures.

The entries on each side sum to a total shown at the bottom; the totals on each side are equal.

BEA (2015) Measuring the Economy: A Primer on GDP and the National Income and Product Accounts

GDP Measures Production

- The GDP data are usually presented in a format that emphasizes exchange (the use of GDP) rather than production (the source of GDP).
- GDP can be represented as the sum of consumer spending, housing and business investment, net exports, and government purchases.
- Behind this accounting facade lurks the truth: GDP is generated by individual labor combined with both proprietors' and business capital, raw materials, energy, and technology in a myriad of different industries.
- The Bureau of Economic Analysis (the agency within the Department of Commerce) does show these relationships in the input-output tables and in the GDP-by-industry data tables.
- But most economists and the press focus on the uses of GDP rather than these presentations of GDP as production. For better or worse, the different formats do influence how people think about the sources of economic growth.

Source: Lincoln Anderson, Gross Domestic Product, Econlib.

<https://www.econlib.org/library/Enc/GrossDomesticProduct.html>

GDP v.s. GNP: Difference and History

- GDP measures the goods and services produced within the country's geographical borders, by both U.S. residents and residents of the rest of the world. GNP measures total output by U.S. citizens, domestic and abroad. The difference is net factor income received from abroad.
- Beginning with the comprehensive update of the National Income and Product Accounts (NIPAs) in November 1991, the Bureau of Economic Analysis began releasing estimates of GDP as its featured measure of U.S. production, rather than GNP, the measure in use since 1934.
- The change from GNP to GDP reflected a more appropriate measure for U.S. aggregate production, particularly in short-term monitoring and analysis of the economy. The difference is trivial for the U.S., amounting to only \$13 billion (0.2% of 1991 GDP). This shift in emphasis brings the U.S. into conformance with the international accounting convention.

Nominal GDP v.s. Real GDP

$$NGDP_T = P_T^1 Q_T^1 + P_T^2 Q_T^2 + \dots + P_T^N Q_T^N = \sum_i^N P_T^i Q_T^i$$

$$RGDP_T = P_0^1 Q_T^1 + P_0^2 Q_T^2 + \dots + P_0^N Q_T^N = \sum_i^N P_0^i Q_T^i$$

- Nominal gross domestic product (NGDP): The total market value of all final goods and services produced in an economy in a given year, expressed by using the current year's price for goods and services.
- Real gross domestic product (RGDP): The total market value of all final goods and services produced in an economy in a given year, calculated by using a base year's price (P_0 in the formula) for goods and services.
- NGDP adjusted for inflation is the RGDP. The difference between the two is the effect of inflation on the market value of output. NGDP is known as current-dollar GDP. RGDP is known as constant-dollar GDP.

Nominal and Real GDP Calculation

Year	Price of Hot Dogs	Quantity of Hot Dogs	Price of Hamburgers	Quantity of Hamburgers
2019	\$1	100	\$2	50
2020	2	150	3	100
2021	3	200	4	150

Calculating Nominal GDP

$$2019 (\$1 \text{ per hot dog} \times 100 \text{ hot dogs}) + (\$2 \text{ per hamburger} \times 50 \text{ hamburgers}) = \$200$$

$$2020 (\$2 \text{ per hot dog} \times 150 \text{ hot dogs}) + (\$3 \text{ per hamburger} \times 100 \text{ hamburgers}) = \$600$$

$$2021 (\$3 \text{ per hot dog} \times 200 \text{ hot dogs}) + (\$4 \text{ per hamburger} \times 150 \text{ hamburgers}) = \$1,200$$

Calculating Real GDP (base year 2019)

$$2019 (\$1 \text{ per hot dog} \times 100 \text{ hot dogs}) + (\$2 \text{ per hamburger} \times 50 \text{ hamburgers}) = \$200$$

$$2020 (\$1 \text{ per hot dog} \times 150 \text{ hot dogs}) + (\$2 \text{ per hamburger} \times 100 \text{ hamburgers}) = \$350$$

$$2021 (\$1 \text{ per hot dog} \times 200 \text{ hot dogs}) + (\$2 \text{ per hamburger} \times 150 \text{ hamburgers}) = \$500$$

Calculating the GDP Deflator

$$2019 (\$200/\$200) \times 100 = 100$$

$$2020 (\$600/\$350) \times 100 = 171$$

$$2021 (\$1,200/\$500) \times 100 = 240$$

The GDP deflator is a measure of aggregate price level, which equals NGDP over RGDP.

What are not measured in the GDP?

- ① Nonmarket production in the household—for example, meal preparation, cleaning, laundry, and child care. Therefore, when these activities are, because of greater labor force participation, shifted to the market—as restaurant meals and semiprepared foods in grocery stores, cleaning and laundry services, and day care—the change in the value of production is overstated due to the decline in nonmarket (household) production.¹
- ② Underground economy: transactions that are intentionally hidden from government statisticians. Gray market and illegal activities—such as production and distribution of marijuana or gambling—can be significant sources of sustenance in economies but are not included.
- ③ Physical capital depreciation: reduction of the value of physical capital due to obsolescence or wear and tear. Most productive processes cause physical capital to lose value over time (e.g., buildings, equipments, facilities, and non-renewable natural resources).²

What GDP does not Reveal?

While GDP (and GDP per capita) is used as an indicator of economic size and progress, it is not a measure of the overall standard of living or well-being (for example, it does not account for rates of poverty, crime, or literacy).

- ① Increased output may come at the huge cost of environmental damage, pollution, or other external costs.
- ② It might involve the reduction of leisure time, sacrifice of health, or the depletion of nonrenewable natural resources.
- ③ The quality of life may also depend on the distribution of GDP (equality) among the residents of a country, not just the overall level.

To try to account for such factors, the United Nations computes a Human Development Index, which ranks countries not only based on GDP per capita, but on other factors, such as life expectancy, literacy, and school enrollment. Other attempts have been made to account for some of the shortcomings of GDP, such as the Genuine Progress Indicator and the Gross National Happiness Index, but these too have their critics (Tim Callen, IMF).

GDP as a Well-being Measure: Limitations

- Since its conceptual development in the 1940s, GDP has been criticized for its many limitations: it is blind to environmental degradation, it poorly captures variations in human well-being, and ignores inequality.
- Therefore, increases in GDP by no means indicate that the overall standards of living in a country are improving. This has led over the years to the creation of several alternative indicators, including the Human Development Index, which factors in education and healthcare, and GDP indicators that factor in environmental degradation.
- In the aftermath of the 2008 financial crisis, a new wave of research and policy discourses, exemplified by the Stiglitz-Sen-Fitoussi Commission on measuring well-being, stressed the need to move beyond GDP.
- Measurement of inequalities in human well-being: how economic production actually benefits different groups of individuals (rich and poor, men and women, pre- and post-tax). Environmental impacts.

GDP International Comparison: PPP

How to compare income levels and asset ownership across the world, knowing that the costs of living differ so much between (and within) nations?

- The usual method is to convert the value of GDP of each country into US dollars and then compare them. Conversion to dollars can be done using market exchange rates. However, it may not properly account for inequalities in living standards across the globe.
- A standard way (purchasing-power-parity) to compare inequality in across the globe is to deflate (or inflate) incomes earned in a given country by the cost of goods and services in that country relative to that of others.
- The PPP exchange rate is the rate at which the currency of one country would have to be converted into that of another to purchase the same amount of goods and services in each country.
- Th emerging market and developing countries have a higher estimated dollar GDP when the PPP exchange rate is used.

The Expenditure Components in GDP

Personal C onsumption Expenditures	Also called consumer spending : the goods and services people buy, such as groceries, clothing, cellphone service and health care.
+ I nvestment	This is business spending on fixed assets such as land, buildings and equipment, plus investment in unsold inventory; also includes purchases of homes by consumers.
+ G overnment Spending	Spending by federal, state and local governments to provide goods and services, such as schools, roads or national defense.
+ N et E Xports	Also known as exports minus imports ($X - M$) : the value of exports to other countries minus the value of imports into the United States. <i>Why are imports subtracted? Consumers, businesses and governments spend some of their money on imports. U.S. production would be overstated if the formula didn't remove imports.</i>
= GDP	The total market value of the goods and services produced within the United States in a year.

In NIPAs, the expenditures approach is used to identify the goods and services purchased by persons, businesses, governments, and foreigners. It is calculated by summing the final expenditures components. Source: BEA—What is GDP?

The Expenditure Approach

- ① Consumption (C). In NIPA, personal consumption expenditures consist of purchases of goods and services by households and by nonprofit institutions serving households (NPISHs).
- ② Investment (I). Gross private domestic investment consists of purchases of fixed assets (structures, equipment, and intellectual property products) by private businesses that contribute to production and have a useful life of more than one year, of purchases of homes by households, and of private business investment in inventories.
- ③ Government expenditure (G), Government consumption and investment measures final expenditures by Federal, state, and local governments.
- ④ Exports (EX), which consists of goods and services that are sold, given away, or otherwise transferred by U.S. residents to the rest of the world.
- ⑤ Imports (IM), which is deducted in the calculation of GDP, consists of goods and services that are sold, given away, or otherwise transferred by the rest of the world to U.S. residents.

Summary National Income and Product Accounts, 2012

[Billions of dollars]

Account 1. Domestic Income and Product Account

Line		Line	
1	Compensation of employees, paid	8,618.5	15 Personal consumption expenditures (3-3)
2	Wages and salaries	6,938.9	16 Goods
3	Domestic (3-12)	6,924.0	17 Durable goods
4	Rest of the world (5-15)	14.9	18 Nondurable goods
5	Supplements to wages and salaries (3-14)	1,679.6	19 Services
6	Taxes on production and imports (4-15)	1,132.1	20 Gross private domestic investment
7	Less: Subsidies (4-8)	58.0	21 Fixed investment (6-2)
8	Net operating surplus	4,131.7	22 Nonresidential
9	Private enterprises (2-19)	4,151.0	23 Structures
10	Current surplus of government enterprises (4-28)	-19.3	24 Equipment
11	Consumption of fixed capital (6-14)	2,534.2	25 Intellectual property products
12	Gross domestic income	16,358.5	26 Residential
13	Statistical discrepancy (6-20)	-203.3	27 Change in private inventories (6-4)
14	Gross domestic product	16,155.3	28 Net exports of goods and services
			29 Exports (5-1)
			30 Imports (5-13)
			31 Government consumption expenditures and gross investment (4-1 plus 6-3)
			32 Federal
			33 National defense
			34 Nondesign
			35 State and local
			36 Gross domestic product
			16,155.3

Personal Consumption and Domestic Investment

- Personal consumption expenditures (PCE) include goods and services include imputed expenditures on items such as the services of housing by a homeowner (the equivalent of rent), financial and insurance services for which there is no explicit charge, and medical care provided to individuals and financed by government or by private insurance.
- Gross private domestic investment consists of fixed assets and business inventories. Inventory investment, which is shown as "change in private inventories," includes the value of goods produced during a period but not sold, less sales of goods from inventories that were produced in previous periods.
- It is measured as ending period less beginning period inventories valued at current prices (and is equivalent to additions to, less withdrawals from, inventories). Intermediate inputs, which become an integral part of the final product and do not contribute to future production, are not included in investment.

Source: BEA (2015) Measuring the Economy: A Primer on the National Income and Product Accounts

Government Spendings and Net Exports

- Government consumption expenditures represents the value of goods and services provided to the public by governments (such as defense or education). Gross investment consists of government purchases of structures, equipment, and intellectual property products to use in producing those goods and services. These expenditures do not include government spending for social benefit programs (such as Medicaid), interest payments, and subsidies.
- Net exports is the difference between exports and imports. Since the value of imports is already included in the other expenditure components of GDP, imports must be deducted in order to derive a measure of total domestic output. Deducting total imports purchased by all sectors from total exports, rather than deducting each sector's imports from its total expenditures, provides an analytically useful measure—net exports—that enables one to examine the effects of foreign trade on the economy.

Outline

- ① Data and Facts
- ② Measurement Methods
- ③ Aggregate Expenditures
- ④ Income & Wealth Inequality

Economic Inequality Measurements

- Income includes the revenue streams from wages, salaries, interest on a savings account, dividends from shares of stock, rent, and profits from selling something for more than you paid for it.
- Unlike wealth statistics, income figures do not include the value of homes, stock, or other possessions. Income inequality refers to the extent to which income is distributed in an uneven manner among a population.
- Wealth can be measured by "net worth," the sum total of your assets minus liabilities. Assets can include everything from an owned personal residence and cash in savings accounts to investments in stocks and bonds, real estate, and retirement accounts. Liabilities cover what a household owes: a car loan, credit card balance, student loan, mortgage, or any other bill yet to be paid.
- In the United States, the income gap between the rich and everyone else has been growing markedly, by every major statistical measure, for more than 30 years. On the other hand, wealth inequality runs even more pronounced than income inequality.

<https://inequality.org/facts/racial-inequality/>

Measuring Income Inequality

GDP not only has key limitations to its measurement of well-being, but also has several pitfalls from a purely economic point of view in comparing national incomes.

- GDP filters out (includes) the depreciation of capital used in production processes (not only for roads and computers, but also, in principle, for natural resources to the extent that their value can be monetized). Put differently, if a country increases its output by depleting its capital stock (e.g., forests), GDP will grow, even though the country is arguably getting poorer.
- In addition, GDP is blind to flows of income coming in to the country from abroad and being sent out to other countries. In certain countries, outward flows reduce actual incomes received by nationals by a large margin, while in others, they increase income significantly. Typically, capital income flows go from poor nations to rich countries, which own capital abroad.
- National income (NI) is a better concept than GDP for studying global economic inequality because it takes into account both the depreciation of capital stock and net income flows from abroad. Formally, national income is equal to GDP minus the depreciation of the capital stock used in production processes, plus net incomes received from (or paid to) the rest of the world.

U.S. Income and Wealth Inequality, 2021

- ① Income inequality in the US is among the highest among rich countries. In the US, the average national income of the adult population is \$77,090. While the bottom 50% earns \$20,520 per person, the top 10% earns on average 17 times more (\$350,440). The ratio of 17 between incomes of the top 10% and the bottom 50% is significantly higher than in European countries (ranging from 6 to 10) and in China (14). The top 10% captures 45.5% of total income while just 13.3% goes to the bottom 50%.
 - ② Income inequality is back to historical highs. The top 10% income share dropped significantly after WWII, under strong capital control policies and a rise in federal spending, accompanied by strongly progressive taxation. The 1950-1980s were marked by rapidly rising average incomes. From the early 1980s onward, deregulation, privatizations, decreases in tax progressivity and a decline in union coverage all contributed to a formidable rise in the top 10% share and a drop in the bottom 50%.
 - ③ Wealth inequality levels in the contemporary US are close to those observed at the beginning of the 20th century, with a top 10% wealth share above 70%. Today, average wealth for the top 10%, middle 40% and bottom 50% are respectively equal to \$2,846,360, \$280,150 and \$12,130. The share of total wealth owned by the poorest half of the US population is extremely small (1.5% of the total).
 - ④ Gender inequality: the female labor income share is equal to 39%. While the share has risen since 1990, progress remains slow. Women's representation among the richest is particularly low today (only 12% among the top 1% of income earners).

Global Income and Wealth Inequality, 2021

- ① An average adult earns \$23,380 in 2021, and the average adult owns \$102,600. These averages mask wide disparities both between and within countries. The richest 10% of the global population currently takes 52% of global income, whereas the poorest half of the population earns 8.5% of it. On average, an individual from the top 10% of the global income distribution earns \$122,100 per year, whereas an individual from the poorest half of the global income distribution makes \$3,920 per year.
- ② Global wealth inequalities are even more pronounced than income inequalities. The poorest half of the global population barely owns any wealth at all, possessing just 2% of the total. In contrast, the richest 10% of the global population own 76% of all wealth. On average, the poorest half of the population owns \$4,100 and the top 10% own \$771,300 on average.
- ③ Middle East and North Africa (MENA) is the most unequal region in the world, Europe has the lowest inequality levels. Average national incomes tell us little about inequality.
- ④ Inequality is a political choice, not an inevitability. Income and wealth inequalities have been on the rise nearly everywhere since the 1980s, following a series of deregulation and liberalization programs which took different forms in different countries.
- ⑤ Contemporary global inequalities are close to early 20th century levels, at the peak of Western imperialism. Inequalities within countries are now even greater than the significant inequalities observed between countries.

Source: World Inequality Report (2022) <https://wir2022.wid.world>

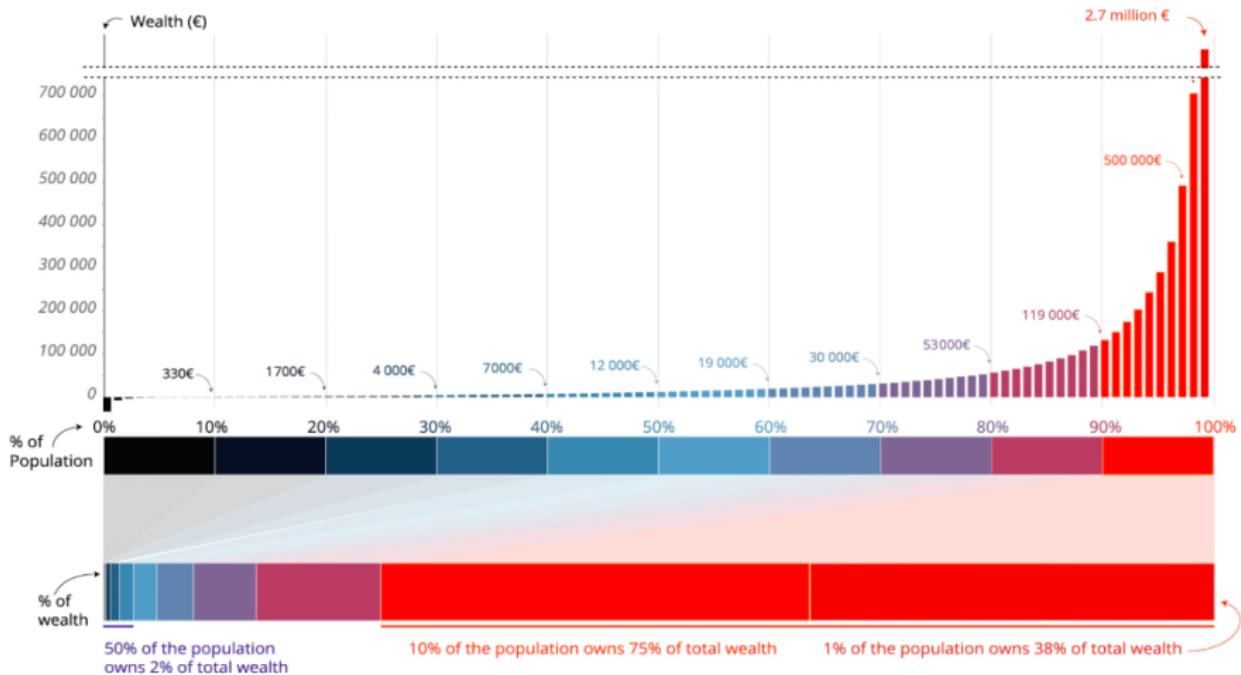

Figure 1.1 Global income and wealth inequality, 2021

Interpretation: The global 50% captures 8.5% of total income measured at Purchasing Power Parity (PPP). The global bottom 50% owns 2% of wealth (at Purchasing Power Parity). The global top 10% owns 76% of total Household wealth and captures 52% of total income in 2021. Note that top wealth holders are not necessarily top income holders. Income is measured after the operation of pension and unemployment systems and before taxes and transfers. **Sources and series:** wir2022.wid.world/methodology

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Wealth Inequality in the World, 2021

Source: World Inequality Report (2022) <https://wir2022.wid.world>

**Table 1.1** The distribution of the world national income and wealth, 2021: Purchasing Power Parity

	Avg. annual income per adult (PPP €)	Income threshold (PPP €)	Avg. wealth per adult (PPP €)	Wealth threshold (PPP €)
Full population	16,700		72,900	
Bottom 50%	2,800		2,900	
Middle 40%	16,500	6,700	40,900	12,000
Top 10%	87,200	37,200	550,900	125,500
Top 1%	321,600	123,900	2,755,200	807,300
Top 0.1%	1,300,800	446,000	14,133,400	3,333,700

Interpretation: The global bottom 50% earns on average PPPC 2,800 of income per adult and per year. Income is measured after pension and unemployment benefits are received by individuals, but before other taxes they pay and transfers they receive. **Sources and series:** wir2022.wid.world/methodology.

Table 1 Global millionaires and billionaires, 2021

Wealth group (\$)	Number of adults	Total wealth (\$ bn)	Average wealth (\$ m)	Global wealth tax	
				Effective wealth tax rate (%)	Total revenues (% global income)
All above 1m	62,165,160	174,200	2.8	1.0	1.6
1m - 10m	60,319,510	111,100	1.8	0.6	0.6
10m - 100m	1,769,200	33,600	19	1.3	0.4
100m - 1b	73,710	16,500	220	1.5	0.2
1b - 10b	2,582	7,580	2,940	2.3	0.2
10b - 100b	159	4,170	26,210	2.8	0.1
Over 100b	9	1,320	146,780	3.2	0.04

Interpretation: In 2021, 62.2 million people in the world owned more than \$1 million (at MER). Their average wealth was \$ 2.8 million, representing a total of \$174 trillion. **Note:** Numbers of millionaires are rounded to the nearest ten. **Sources and series:** wir2022.wid.world/methodology.

Table 4.1 Global distribution of wealth, 2021

	Share in total wealth (%) (2021)	Avg. Per adult wealth (2021 €)	Threshold (2021)	Avg. annual growth rate (1995–2021)
Full population	100%	72,913		3.2%
Bottom 50%	2.0%	2,908		3.7%
Middle 40%	22.4%	40,919	11,954	3.8%
Top 10%	75.6%	550,920	124,876	3.0%
Top 1%	37.8%	2.8 million	893,338	3.2%
Top 0.1%	19.4%	14.1 million	3.6 million	4.0%
Top 0.01%	11.2%	81.7 million	18.0 million	5.0%
Top 0.001%	6.4%	469.0 million	119.4 million	5.9%
Top 1/1 million	3.5%	2.6 billion	674.7 million	6.9%
Top 1/10 million	1.9%	14.2 billion	3.7 billion	8.1%
Top 1/100 million	1.1%	77.4 billion	20.3 billion	9.3%

Interpretation: The global top 1% own 38% of total household wealth, and have had an average annual growth rate of 3.2% since 1995. The global average wealth per adult was 72,910€ (at Purchasing Power Parity) in 2021. Net household wealth is equal to the sum of financial assets (e.g. equity or bonds) and non-financial assets (e.g. housing or land) owned by individuals, net of their debts. The top 1/100 million represents 52 persons. **Sources and series:** wir2022.wid.world/methodology, Bauluz et al. (2021) and updates.

Source: World Inequality Report (2022) <https://wir2022.wid.world>

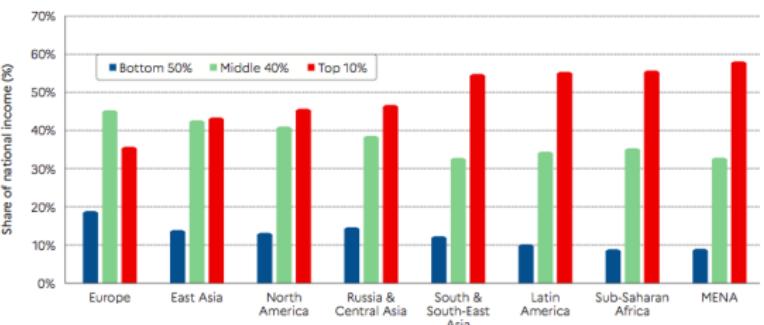

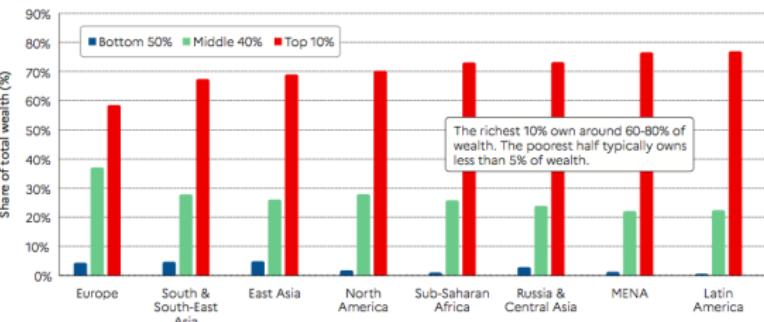

Figure 1.3 The poorest half lags behind: Bottom 50%, middle 40% and top 10% income shares across the world in 2021

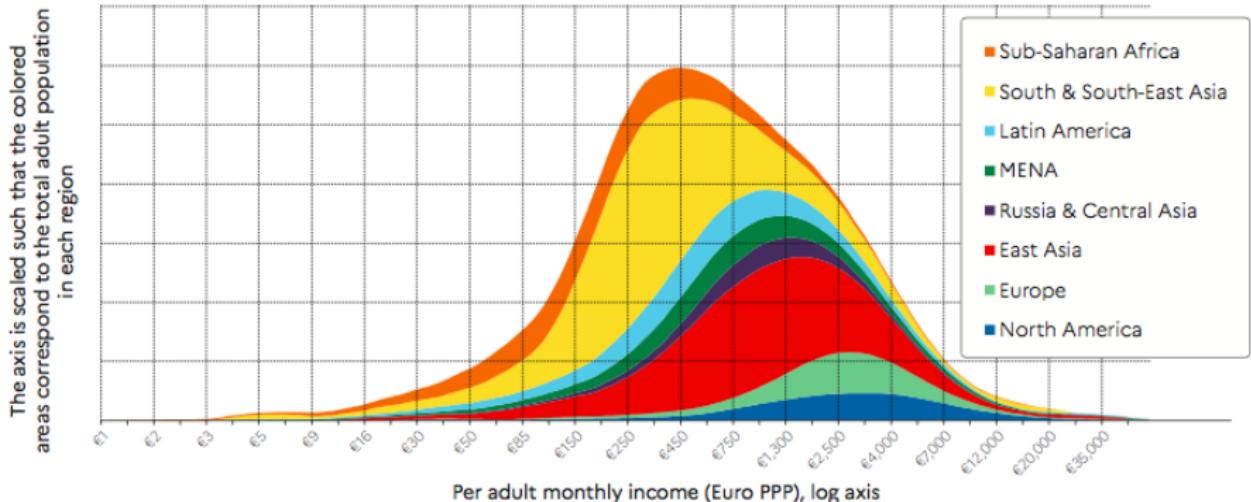

Interpretation: In Latin America, the top 10% captures 55% of national income, compared with 36% in Europe. Income is measured after pension and unemployment benefits are received by individuals, but before income taxes and other transfers. **Sources and series:** wir2022.wid.world/methodology

Figure 4 The extreme concentration of capital: wealth inequality across the world, 2021

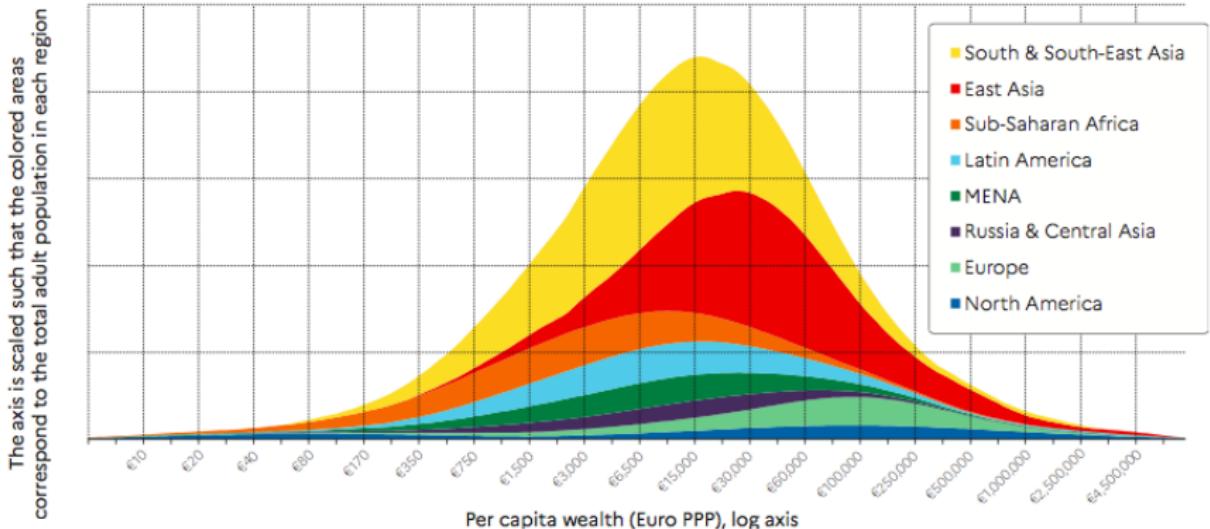

Interpretation: The top 10% in Latin America captures 77% of total household wealth, compared with 1% captured by the bottom 50%. Net household wealth is equal to the sum of financial assets (e.g. equity or bonds) and non-financial assets (e.g. housing or land) owned by individuals, net of their debts. **Sources and series:** wir2022.wid.world/methodology.

Figure 1.7 Global income distribution in 2021

Interpretation: The graph shows the size and geographical repartition of the global population at different levels of the income distribution. The relative size of each color wedge is proportional to the population in a region. Incomes are measured after pension and unemployment benefits are received by individuals, and before income and wealth taxes. **Sources and series:** wir2022.wid.world/methodology.

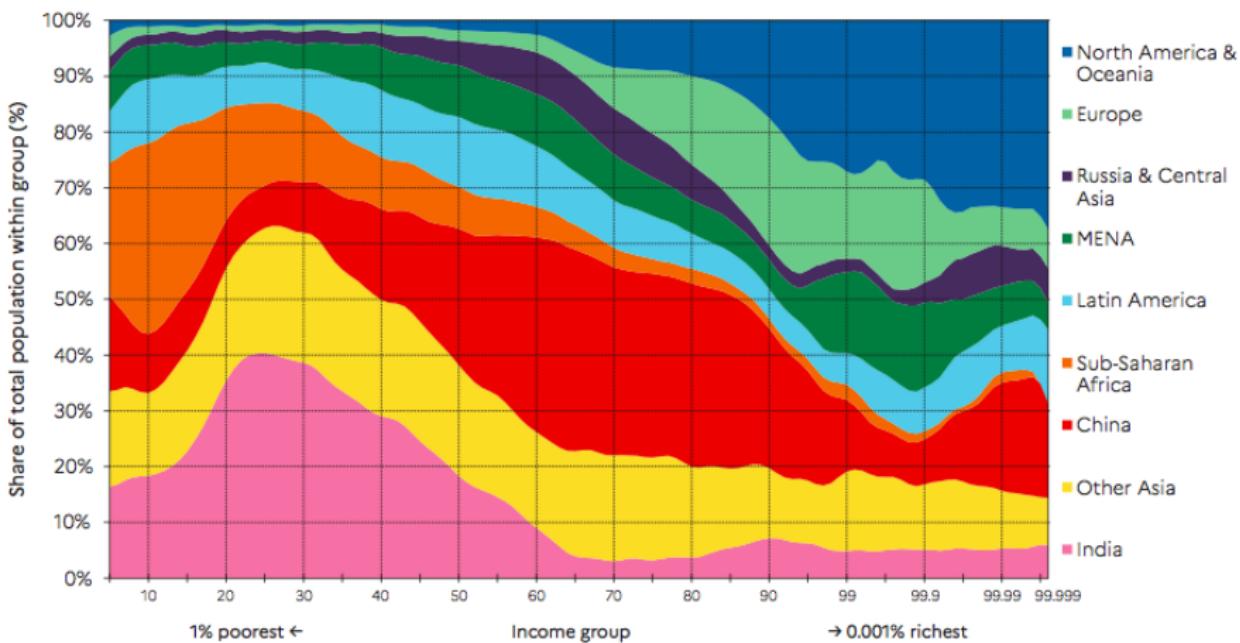

Note: MENA - Middle East/North Africa. Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 1.15 Global wealth distribution in 2021

Interpretation: The graph shows the size and geographical repartition of the global population at different levels of the wealth distribution.

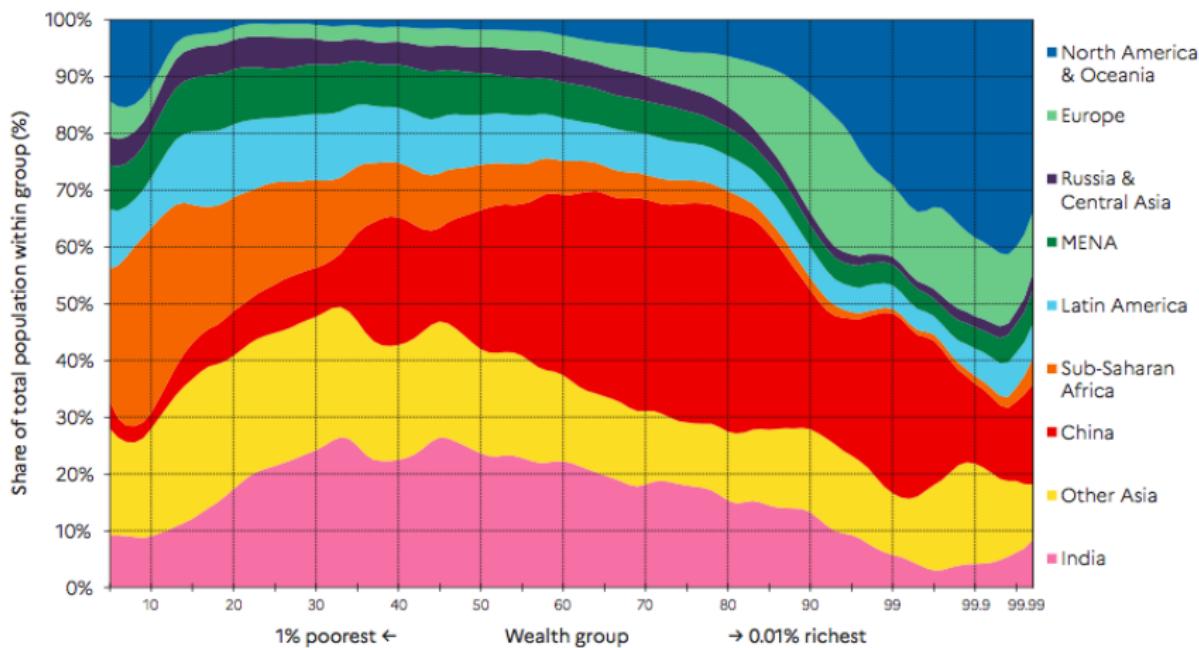

The relative size of each color wedge is proportional to the population in a region. Distribution of household wealth, net of debts. **Sources and series:** wir2022.wid.world/methodology

Note: MENA - Middle East/North Africa. Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 1.8 Geographic Breakdown of global income groups in 2021

Interpretation: The graph shows the geographical breakdown of global income groups. In 2021, 18% of the population of the world's top 0.001% income group were residents of China. Income measured after pension and unemployment benefits are received by individuals, and before income and wealth taxes. **Sources and series:** wir2022.wid.world/methodology.

Note: MENA - Middle East/North Africa. Source: World Inequality Report (2022) <https://wir2022.wid.world>

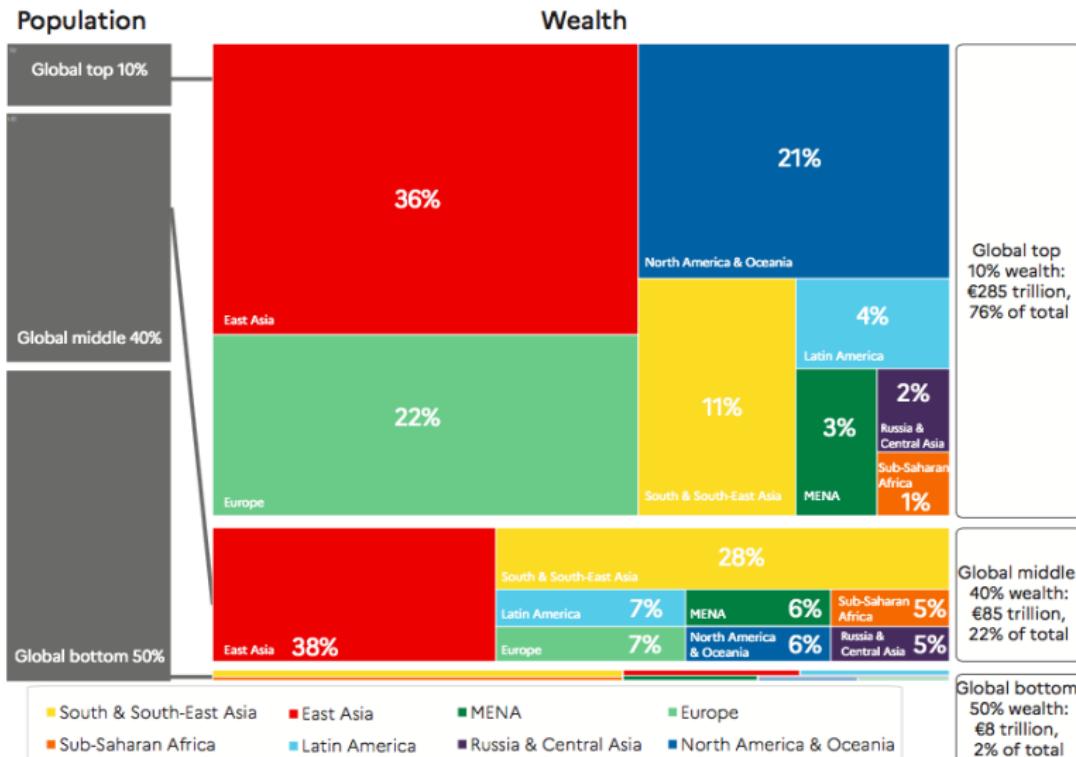

Figure 1.16 Geographic Decomposition of global wealth groups in 2021

Interpretation: The graph shows the geographical repartition of the global population at different levels of the wealth distribution. In 2021, 34% of the top 0.01% wealth group were residents of North America and Oceania. Distribution of household wealth, net of debts.

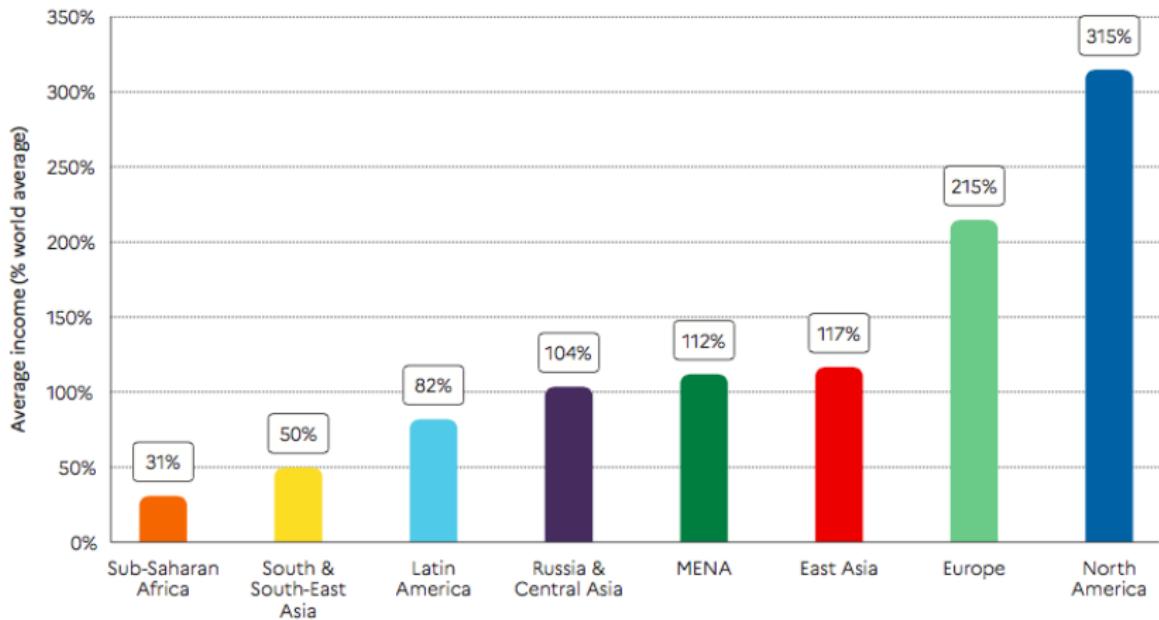

Sources and series: wir2022.wid.world/methodology

Figure 1.2a Average income across world regions, 2021

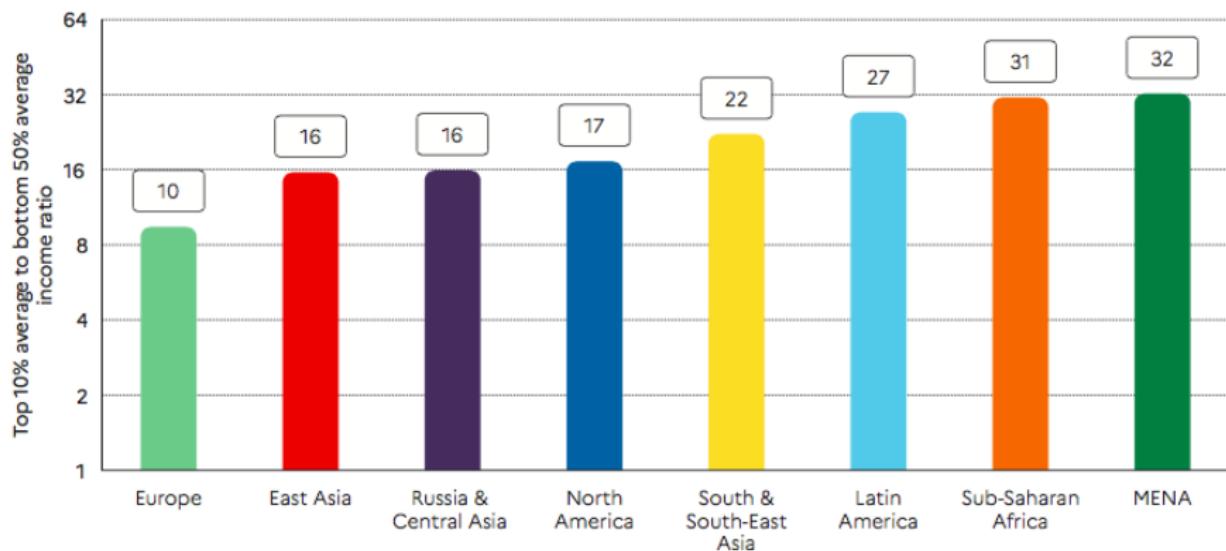

Interpretation: In 2021, the average income of North America is 315% of world average wealth (at Purchasing Power Parity). **Sources and series:** wir2022.wid.world/methodology

Note: MENA - Middle East/North Africa. Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 1.2b Average wealth across world regions, 2021

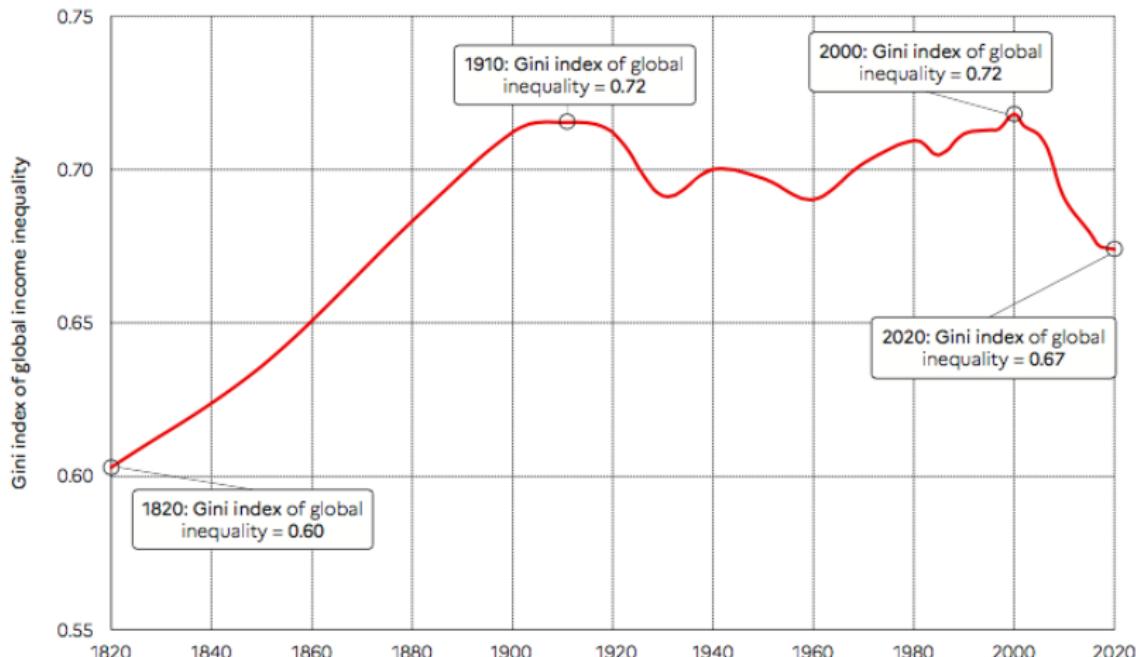

Interpretation: In 2021, the average wealth of North America is 390% of world average income (at Purchasing Power Parity). Net household wealth is equal to the sum of financial assets (e.g. equity or bonds) and non-financial assets (e.g. housing or land) owned by individuals, net of their debts. **Sources and series:** wir2022.wid.world/methodology.

Note: MENA - Middle East/North Africa. Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 1.4 Income gaps across the world: Top 10 % vs. Bottom 50%, 2021

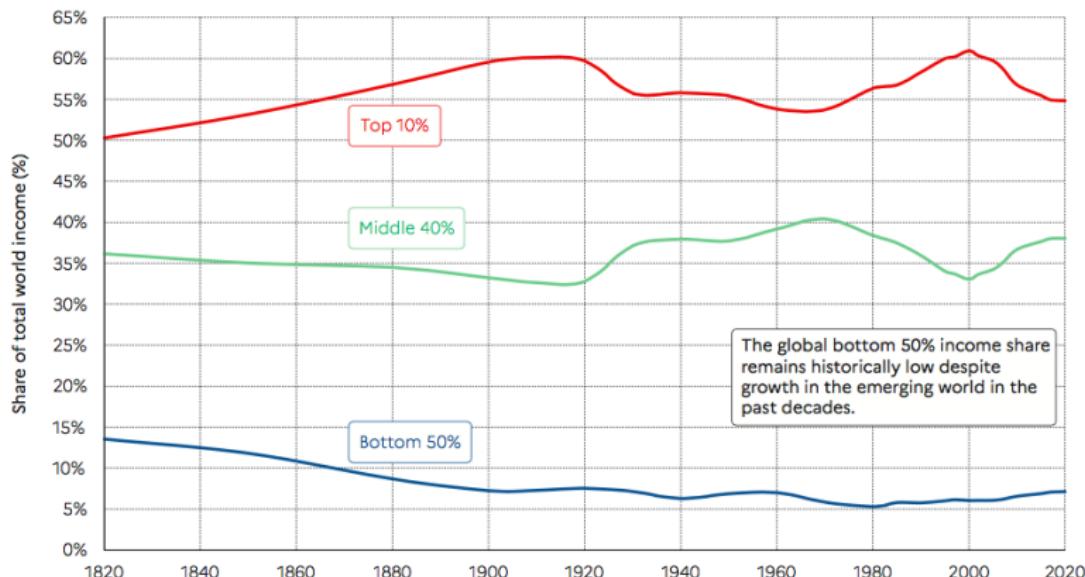

Interpretation: In Latin America, the bottom 50% earns 27 times less than the top 10%. The value is 9 in Europe. Income is measured after pension and unemployment benefits are received by individuals, but before other taxes they pay and transfers they receive. **Sources and series:** wir2022.wid.world/methodology, numbers may not add up due to rounding

Note: MENA - Middle East/North Africa. Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 2.3 Global income inequality: Gini index, 1820-2020

Interpretation: Global inequality, as measured by the global Gini coefficient, rose from about 0.6 in 1820 to about 0.7 in 1910, and then stabilized around 0.7 between 1910 and 2020. It is too early to say whether the decline in the global Gini coefficient observed since 2000 will continue. Income is measured per capita after pension and unemployment insurance transfers and before income and wealth taxes. **Sources and series:** wir2022.wid.world/methodology and Chancel and Piketty (2021).

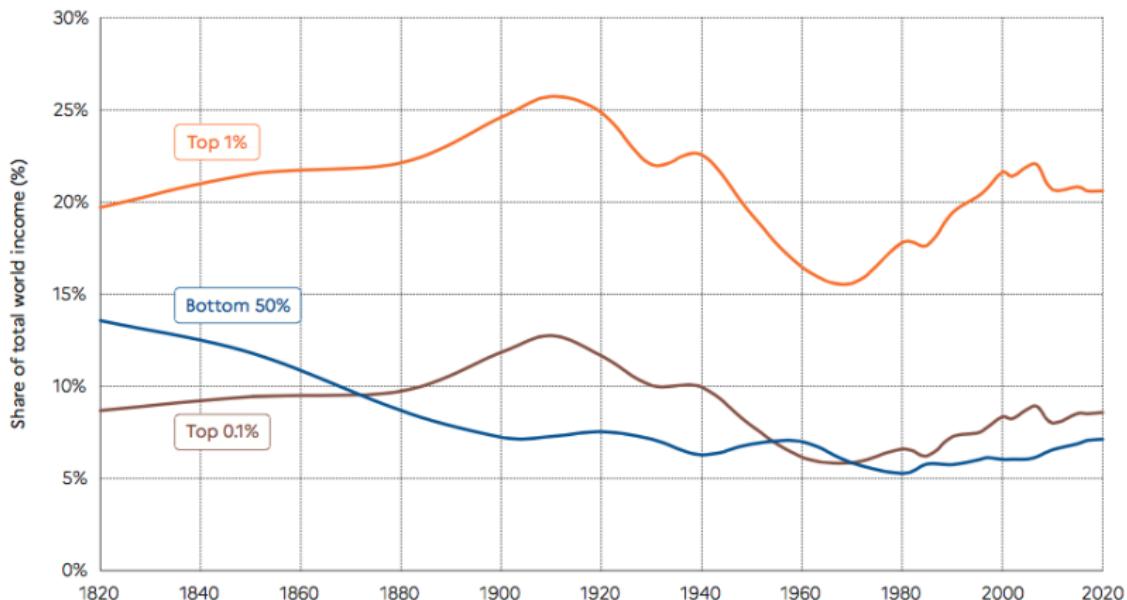

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 2.1 Global income inequality: bottom 50%, middle 40% and top 10%, 1820-2020

Interpretation: The share of global income going to top 10% highest incomes at the world level has fluctuated around 50-60% between 1820 and 2020 (50% in 1820, 60% in 1910, 56% in 1980, 61% in 2000, 55% in 2020), while the share going to the bottom 50% lowest incomes has generally been around or below 10% (14% in 1820, 7% in 1910, 5% in 1980, 6% in 2000, 7% in 2020). Global inequality has always been very large. It rose between 1820 and 1910 and shows little change over the long term between 1910 and 2020. Income is measured per capita after pension and unemployment insurance transfers and before income and wealth taxes. **Sources and series:** wir2022.wid.world/methodology and Chancel and Piketty (2021).

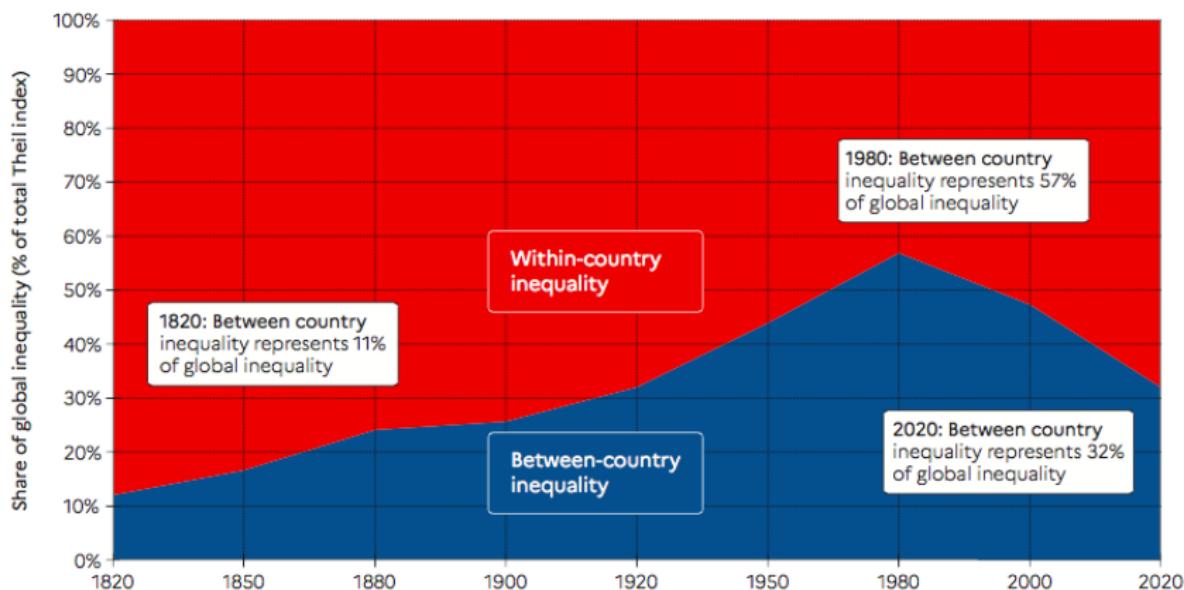

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 2.6 Global income inequality: top 1% and top 0.1% vs bottom 50% income shares, 1820-2020

Interpretation: The share of global income going to the top 1% highest incomes at the world level has hovered around 15-25% between 1820 and 2020 (20% in 1820, 26% in 1910, 16% in 1970, 21% in 2020) and has always been substantially greater than the share going to the bottom 50%, which has generally been of the same order of magnitude as the share going to the top 0.1%. Income is measured per capita after pension and unemployment insurance transfers and before income and wealth taxes. **Sources and series:** wir2022.wid.world/methodology and Chancel and Piketty (2021).

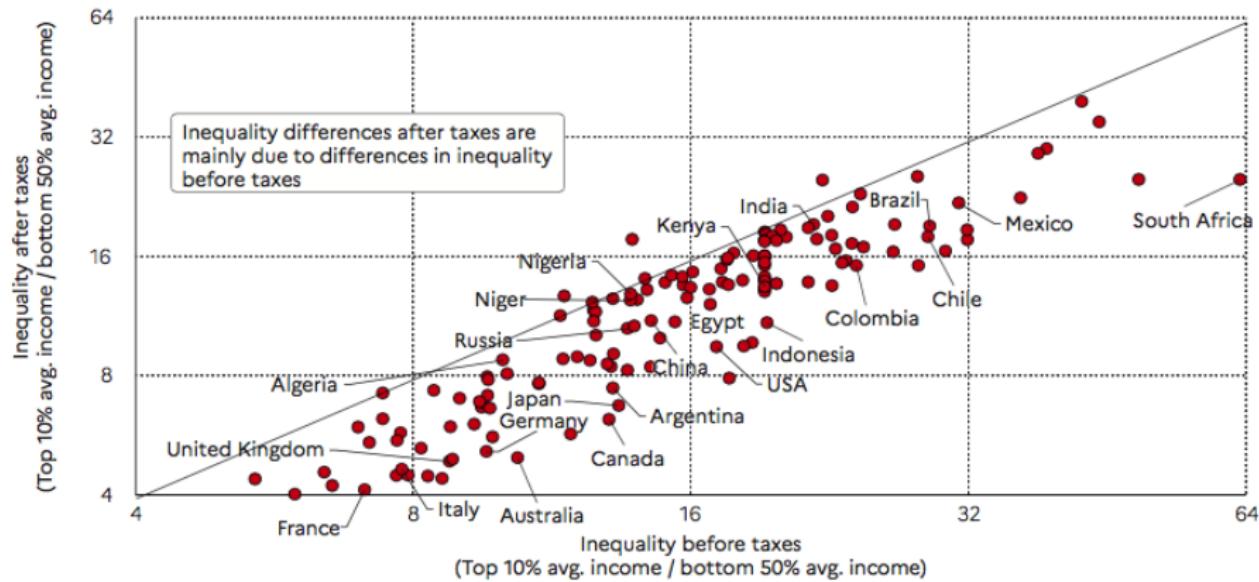

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 6 Global income inequality: Between vs. within country inequality (Theil index), 1820-2020

Interpretation: The importance of between-country inequality in overall global inequality, as measured by the Theil index, rose between 1820 and 1980 and strongly declined since then. In 2020, between-country inequality makes up about a third of global inequality between countries. The rest is due to inequality within countries. Income is measured per capita after pension and unemployment insurance transfers and before income and wealth taxes. **Sources and series:** wir2022.wid.world/methodology and Chancel and Piketty (2021).

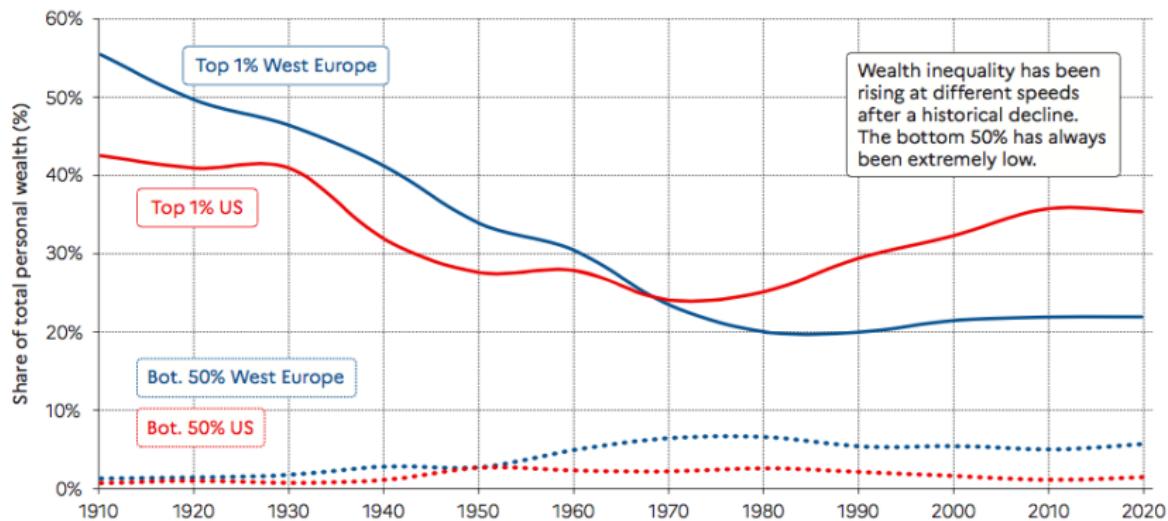

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 1.10 Inequality before and after taxes 2018-2021: Top 10/Bottom 50 income gap

Interpretation: Before taxes, the bottom 50% in South Africa earns 63 times less than the top 10%, whereas after taxes, the bottom 50% earns 24 times less than the top 10%. Income is measured after pension and unemployment payments and benefits received by individuals but before other taxes they pay and transfers they receive. Data for 2018-2021. **Sources and series:** wir2022.wid.world/methodology

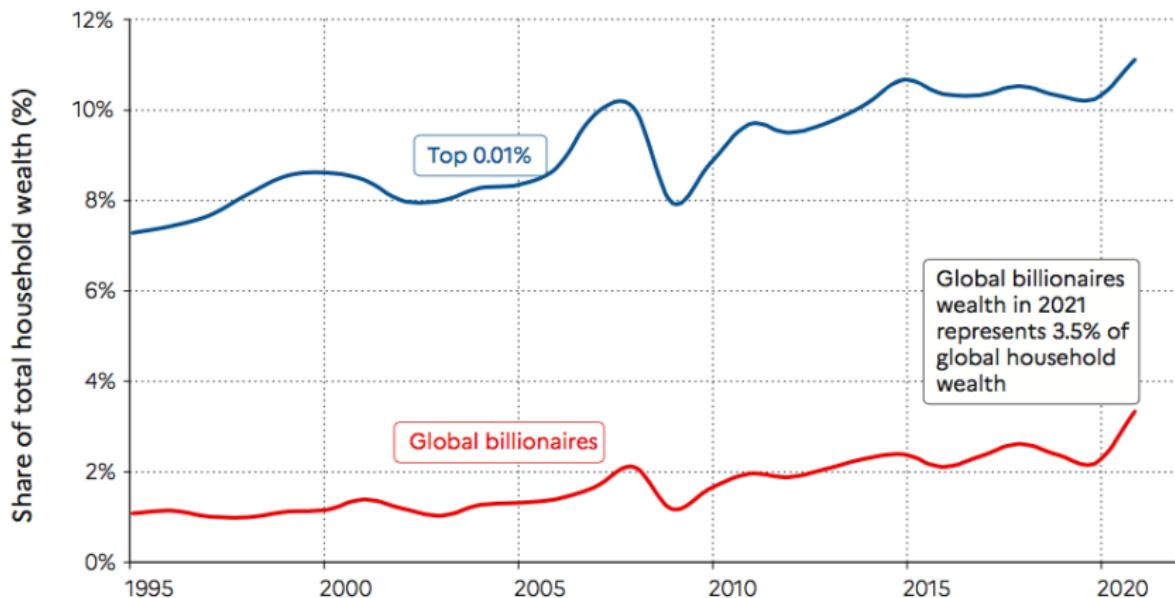

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 4.4 Top 1% versus bottom 50% wealth shares in Western Europe and the US, 1910-2020

Interpretation: The graph presents decennial averages of top 1% personal wealth shares in Western Europe and the US. In 1910, the top 1% in Europe owned 55% of wealth, vs. 43% in the U.S. A century later, the US is almost back to its early 20th century level. Net household wealth is equal to the sum of financial assets (e.g. equity or bonds) and non-financial assets (e.g. housing or land) owned by individuals, net of their debts. **Sources and series:** wir2022.wid.world/methodology, Bauluz et al. (2021) and updates.

Figure 4.3b Extreme wealth inequality: the rise of global billionaires, 1995-2021

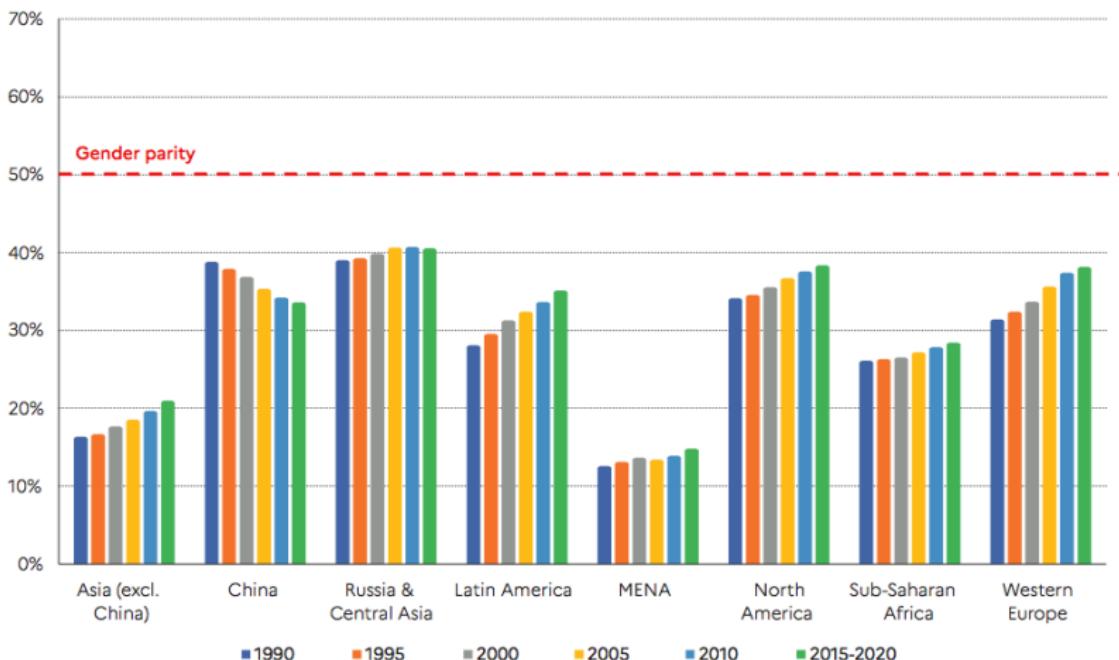

Interpretation: The share of wealth detained by the global top 0.01% rose from 7% in 1995 to 11% in 2021. The top 0.01% is composed of 520 000 adults in 2021. The entry threshold of this group rose from €693,000 (PPP) in 1995 to €16,666,000 today. Billionaires correspond to individuals owning at least \$1b in nominal terms. The net household wealth is equal to the sum of financial assets (e.g. equity or bonds) and non-financial assets (e.g. housing or land) owned by individuals, net of their debts. **Sources and series:** wir2022.wid.world/methodology, Bauluz et al. (2021) and updates.

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 4.3a Extreme wealth inequality: top 0.001% vs. bottom 50% wealth share, 1995-2021

Interpretation: The share of household wealth detained by the richest 0.001% of adults rose from less than 3.5% of total wealth in 1995 to nearly 6.5% today. After a very slight increase, the share of wealth owned by the poorest half of the population has stagnated since the early 2000s at around 2%. Net household wealth is equal to the sum of financial assets (e.g. equity or bonds) and non-financial assets (e.g. housing or land) owned by individuals, net of their debts. **Sources and series:** wir2022.wid.world/methodology, Bauluz et al. (2021) and updates.

Figure 5.2 Female labor income share across the world, 1990-2020

Interpretation: The female labour income share rose from 34% to 38% in North America between 1990 and 2020. **Sources and series:** wir2022.wid.world/methodology and Neef and Robilliard (2021).

Source: World Inequality Report (2022) <https://wir2022.wid.world>

Figure 5.4 Regional trends in earnings and employment ratios, 1990-2020

Interpretation: In the MENA region, a woman earns 61% of what a man earns in 2020, whereas the ratio of employed women to employed men is only 29%. **Sources and series:** wir2022.wid.world/methodology and Neef and Robilliard (2021)
